# INTRODUCTION

## TO TRULY ENDLESS BELT

Megadyne commenced manufacturing transmission belts in 1957 and extruding polyurethane endless belts in 1990. MEGAFLEX belts are manufactured in thermoplastic polyurethane, which gives superior wear and abrasion resistance. Various grades of steel cords offer good running characteristics even with high tractive load. Great production flexibility grant to designers the possibility to match any technical requirement and solution. By selecting different components and materials, MEGAFLEX belts can be manufactured to meet every customer requirement.

Megadyne has expanded the MEGAFLEX range to include:

### **MEGAFLEX FCM, MEGAFLEX XMD**

On request and with a minimum quantity, it's possible to produce MEGAFLEX FCM, made in sky blue colour (RAL 5012) and certified for direct contact with dry and wet food.

MEGAFLEX FCM can be made with a special metal and X-ray detectable compound. MEGAFLEX XMD decreases the risk of contamination from belt fragments protecting consumer' safety.

### **MEGAFLEX MEGAECO BIOBASED**

MEGAFLEX MegaEco Biobased is part of the Megadyne MegaEco range, the sustainable belt solution for power transmission systems. Made with polymer coming partially from vegetable sources, this "eco-friendly" belt can support companies to reduce their CO<sub>2</sub> footprint.

# PRODUCT RANGE

Thanks to their features, MEGAFLEX belts can be successfully used in a wide range of application such as:

- High Power Transmissions
- Ceramic industry
- Marble & Stone industry
- Glass Industry
- Painting Mixer machines
- Heavy Transport systems
- Wood industry
- Food industry

# CLASSIFICATIONS

## CLASSIFICATIONS

MEGAFLEX timing belts are manufactured in thermoplastic polyurethane, with single helicoidal steel cords. This type of belts, developed by our Research & Development, offer good running characteristics and high-traction loads. They are especially suited for power transmissions and conveying with high loads and speeds. The addition of a nylon coating on the teeth during production enhances the running properties for specific applications and reduces the noise thanks to a lower frictional coefficient. On the back of the belt an extra thickness of special coating is also possible, offering extra protection against aggressive or heavy products.

- 1.** The body of the belts is made of a white thermoplastic polyurethane 92 ShA, characterized by high levels of wear resistance even in the presence of shock and surge loading; special compound on request (see on page 49).
- 2.** High-strength helicoidal zinked steel tension members allow high-breaking load and extremely low elongation. The combination of these high-grade materials improves belt performance, which can be summarised as follows:

- exceptional resistance to abrasion and tooth shear
- low coefficient of friction
- high flexibility
- ozone and temperature resistance (-25 °C / +80 °C)
- oil, grease, and gasoline resistance.

## MECHANICAL AND CHEMICAL CHARACTERISTICS

- Constant dimensions
- Noiseless
- Free maintenance
- High flexibility
- High resistance steel traction cords, with little stretching and top flexibility
- Linear speeds up to 20 m/s
- Low pretension
- Constant length
- High abrasion resistance
- Ageing, Hydrolysis, Ozone resistant
- Working temperature -25 °C / +80 °C
- High resistance to oils, greases, and gasoline
- Fairly Acid-proof and Alkali-proof

# CLASSIFICATIONS

## MECHANICAL AND CHEMICAL CHARACTERISTICS

### **BODY**

MEGAFLEX belts are manufactured with white thermoplastic Polyurethane 92 ShA as standard.

Special compounds (different hardness, special properties) are available on request. Special compound and cords have to be tested and homologated on the application. Megadyne is not responsible for the wrong functioning of special product. Here under some PU characteristics:

### **WATER**

No problem in normal or sea clean water, at room temperature. Over 60 °C there is a fast decrement of breaking strength.

### **ACIDS**

In acid diluted proportions, at room temperature, this PU is moderately attacked. In high-concentration acid solutions, this PU has a very short lifespan. Over 50 °C, acids are always dangerous for Thermoplastic PU.

### **ALKALIS**

In alkalis diluted proportions, at room temperature, this PU is moderately attacked. In high-concentration alkaline solutions, this PU has a very short lifespan. Over 50 °C, alkalis are always dangerous for Thermoplastic PU.

### **SOLVENTS**

Thermoplastic PU is insoluble in the greater part of solvents. Only the very polar solvents (like tetrahydrofuran, dimethylformamide, n-methylpyrrolidone) can dissolve or tight damage PU. The Esters or the Ketons (such as ethyl acetate or methylethylketene) can usually produce a bulge, decreasing mechanical characteristics. Aromatic Hydrocarbons and aliphatic Hydrocarbons produce very high bulge. All effects increase by increasing temperatures.

### **OILS**

PU has a high resistance to mineral pure oils (lubricants, engine oils, combustible oils). Usually, high-performance synthetic oils, due to special additives contained, can be incompatible with Thermoplastic PU, especially at high temperatures.

### **GREASES**

PU has a high resistance to mineral pure greases (lubricating greases). Usually, high-performance synthetic greases, due to special additives contained, can be incompatible with Thermoplastic PU, especially at high temperatures.

### **FUELS**

Good resistance to petrol without alcohol. In presence of alcohol, Thermoplastic PU can suffer deterioration. Fuels, including aromatic stuff, can produce reversible bulges.

### **MICROORGANISMS**

In presence of grime, containing humidity, microorganisms can develop. In the event that microbial attack could pose a danger, you must use a special kind of PU.

### **WEATHER AGENTS**

Good resistance to atmospheric agents. White colour can change into light yellow under long UV exposure. In any case this hasn't influence on mechanical properties.

# CLASSIFICATIONS

## MECHANICAL AND CHEMICAL CHARACTERISTICS

### **CORDS**

#### **STANDARD CORD**

MEGAFLEX is manufactured with helicoidal zinked steel cords as standard.

#### **KEVLAR®**

Kevlar® tension cords are suggested in:

- Non-magnetic, for use in drives with metal detectors
- Food industry
- Applications in damp environments must be avoided

Kevlar® cord belts have a lower dimensional stability compared to steel-cord belts. Length and tolerance may change.

#### **HP**

High Performance cords have 25% more strength capacity than standard cords. They are recommended for high-repeatability applications.

#### **HF**

High Flexibility cords can accept smaller pulley and idler diameters than standard cords. They are suitable for multi-shaft drives with severe reverse bending.

#### **HPF**

High Performance and Flexibility cords have 25% more strength capacity, like the HP cords, but they are more flexible than the HP cords. They are suggested for high-performance and multi-shaft drives.

#### **STAINLESS STEEL**

Stainless steel cords have 25% less strength capacity than standard cords. They are recommended for water applications.

# CLASSIFICATIONS

## COATING

MEGAFLEX can be manufactured with special coating on the teeth or on the back. Please check on pages 50 and 51. Other covers on request.

## IDENTIFICATION CODE

Using the information in the table below, it is possible to identify the correct belt for every application. The code is composed of letters and numbers like in the following example:

<b>1</b>		<b>2</b>		<b>3</b>		<b>4</b>		<b>5</b>		<b>6</b>
MFX	+	50	+	AT	+	10	+	10000	+	SPECIAL MANUFACTURES

<b>1</b>	<b>MFX</b>	MEGAFLEX.
<b>2</b>	<b>50</b>	This number indicates the requested belt width. The value is in mm for a belt with pitch in mm, and in inches for a belt with pitch in inches.
<b>3</b>	<b>AT</b>	This code is composed by letters and indicates the profile.
<b>4</b>	<b>10</b>	This number indicates the standard pitch of the belt. It is expressed in mm.
<b>5</b>	<b>10000</b>	The last number indicates the length of the belt always in mm regardless of pitch.
<b>6</b>	<b>SPECIAL MANUFACTURES</b>	Special cords as Kevlar® or HP or HF or HPF or stainless steel Special compound as different hardness (85 ShA) or different colours (black - red - yellow - blue) Extra coating (NFT or AVAFC or Tenax or Linatex or Honeycomb or PU black cellulose or PU yellow or Neoprene rubber). Please see on page 50 and 51

# TECHNICAL CALCULATION

SYMBOL	UNIT	DEFINITION	SYMBOL	UNIT	DEFINITION
<b>b</b>	mm	belt width	<b>F<sub>p</sub></b>	N	pretension
<b>L</b>	mm	belt length	<b>F<sub>u</sub></b>	N	peripheral force
<b>c</b>	mm	centre distance	<b>F<sub>p spec</sub></b>	N/cm	transmittable force per tooth per unit
<b>d<sub>i</sub></b>	mm	pitch diameter of pulley i	<b>M<sub>t</sub></b>	Nm	drive torque
<b>m</b>	kg	total conveyed mass	<b>n<sub>i</sub></b>	1/min	revs/min (RPM) on pulley i
<b>a</b>	m/s <sup>2</sup>	acceleration	<b>P</b>	kW	drive power
<b>v</b>	m/s	belt speed	<b>Q</b>	N	force exerted by mass (m)
<b>C<sub>s</sub></b>	-	safety factor	<b>z<sub>i</sub></b>		number of teeth on the pulley i
<b>g</b>	m/s <sup>2</sup>	gravity (9.81)	<b>z<sub>m</sub></b>		number of teeth in mesh on the drive pulley
<b>μ</b>	-	coefficient of friction between belt and guide	<b>z<sub>s</sub></b>		number of teeth on the small pulley
<b>p</b>	-	belt pitch	<b>z<sub>L</sub></b>		number of teeth on the largest pulley
<b>MTL</b>	N	Max Traction Load	<b>BS</b>	N	Breaking Strength

Max traction load is the maximum acceptable traction on cords.  
Breaking-strength is the necessary load to break the belt's cords.

## CHOICE OF BELT PITCH, LENGTH AND PULLEY

For an optimal belt pitch see tables on page 10.

For an optimal choice of pulley size, it is desirable to have as nearest to 12 teeth in mesh as possible.

Belt length will be approximately:

$$L = 2c + 1,57 (d_1 + d_2) + \frac{(d_2 - d_1)^2}{4c}$$

Please always check available lengths in belt data pages, consider you must have an integer number of teeth.  
The actual center distance will be:

$$c = \frac{1}{4} \left[ L - \frac{p}{2} (z_1 + z_2) + \sqrt{\left[ L - \frac{p}{2} (z_1 + z_2) \right]^2 - 2 \left[ \frac{p}{\pi} (z_2 - z_1) \right]^2} \right]$$

# TECHNICAL CALCULATION

## CALCULATION OF THE PERIPHERAL FORCE ON THE TIMING BELT

<b>Knowing mass</b>	For horizontal & conveying drives <i>(Note: values of <math>\mu</math> can be found in table 3 on page 12)</i>	$F_u = (m \cdot a) + (m \cdot g \cdot \mu)$
	For vertical drives	$F_u = (m \cdot a) + (m \cdot g)$
<b>Knowing drive torque</b>	-	$F_u = 2000 M_t / d_1$
<b>Knowing drive power</b>	-	$F_u = 19,1 \cdot 10^6 \cdot P / (d_1 \cdot n_1)$

## DETERMINATION OF THE BELT WIDTH

The belt width  $b$  should be calculated using the following formula

$b = (F_u \cdot c_s \cdot 10) / (F_{p \text{ spec}} \cdot Z_m)$	<b><math>C_s</math></b>	safety factor from page 13 table number 4
	<b><math>F_u</math></b>	from above calculation
	<b><math>Z_m</math></b>	number of teeth in mesh on driver pulley <i>(nearest lower integer number)</i>
	<b><math>Z_m</math></b>	$[0,5 - \frac{4 \cdot p}{79 \cdot c} (Z_L - Z_2)] \cdot Z_s$ <i>(if calculated <math>Z_m &gt; 12</math> for an open-end application use <math>Z_m = 12</math>)</i>
	<b><math>F_{p \text{ spec}}</math></b>	transmittable force per tooth per unit width <i>(see table on belt data pages)</i>

## PRE-TENSIONING

The suggested installation tension, see on page 12.

## CORD CHECK

**ESPECIALLY FOR POWER TRANSMISSION, CHECK CAREFULLY ACCORDING TO PROCEDURE**

The maximum allowable tensile load of the belt pitch/width combination selected (see tables on belt data pages):

$$\text{max traction load of chosen belt} > \frac{F_p}{2} + (F_u \cdot C_s)$$

## SPROCKET AND IDLER DIAMETER CHECK

Ensure that all selected pulley and idler diameters are equal to, or greater than, the minimum value specified in corresponding belt data page.

# CALCULATION EXAMPLE

## CHOICE OF BELT PITCH, LENGTH AND PULLEY

According to the belt pitch selection, table n.1 on page 11, considering the value of P and RPM, we select RPP5.

Then we consider the nearest pulley diameter to the requested value and the corresponding n. of teeth (see technical information on page 29). Therefore  $z_1 = 30$  teeth ( $d_1 = 47,75$  mm) and  $z_2 = z_1 \cdot 2 = 60$  ( $d_2 = 95,49$  mm). Belt length is  $L = 2c + 1,57 (d_1 + d_2) + [(d_2 - d_1)^2 / 4c] = 2 \cdot 900 + 1,57 \cdot (47,75 + 95,49) + (95,49 - 47,75)^2 / (4 \cdot 900) = 2025,5$  mm.

Because of this, the actual center distance will be:

$$c = \frac{1}{4} \left[ L - \frac{p}{2} (z_1 + z_2) + \sqrt{\left[ L - \frac{p}{2} (z_1 + z_2) \right]^2 - 2 \left[ \frac{p}{\pi} (z_2 - z_1) \right]^2} \right]$$

$$c = \frac{1}{4} \left[ 2025 - \frac{5}{2} (30 + 60) + \sqrt{\left[ 2025 - \frac{5}{2} (30 + 60) \right]^2 - 2 \left[ \frac{5}{\pi} (60 - 30) \right]^2} \right] = 899,68 \text{ mm}$$

## CALCULATION OF THE PERIPHERAL FORCE ON THE TIMING BELT

$$F_u = 19,1 \cdot 10^6 \cdot \frac{P}{(d_1 \cdot n_1)}$$

$$F_u = 19,1 \cdot 10^6 \cdot \frac{2}{(47,75 \cdot 1500)} = 534 \text{ N}$$

## DETERMINATION OF BELT WIDTH

$b = \frac{F_u \cdot C_s \cdot 10}{F_{p \text{ spec}} \cdot Z_m}$	$F_u$	from before (534N)
	$C_s$	from page 13 table 4, $C_s = 1,5$
$b = \frac{534 \cdot 1,5 \cdot 10}{24 \cdot 12} = 27,8 \text{ mm}$	$Z_m$	14,6 > 12 so $Z_m = 12$
	$n_1$	300 RPM (given)
	$F_{p \text{ spec}}$	24N/cm (refer on page 29 at 1500 RPM)

Since the next closest width is 30mm: 30RPP5 is chosen.

## PRE-TENSIONING

$$F_p = F_u$$

$$F_p = 534 \text{ N}$$

## CORD CHECK

**ESPECIALLY FOR POWER TRANSMISSION, CHECK CAREFULLY ACCORDING TO PROCEDURE**

From page 29 max traction load is 2100N

$$\text{max traction load} > \frac{F_p}{2} + (F_u \cdot C_2)$$

$$\frac{709}{2} + (534 \cdot 1,5) = 1155 \text{ N}$$

2100N > 1155N selected belt is acceptable.

## SPROCKET AND IDLER DIAMETER CHECK

Checking the data on page 29 for pulleys and idlers, it can be seen that the drive has an acceptable pulley diameter.

The selected belt is **30 RPP5 2025**.

### MACHINE DATA

- P = 2kW
- Revolution = 1500 1/min
- Center distance = 900 mm
- Speed ratio (request) = 1:2
- Max radial space = 55mm in the driven pulley
- Rotary presses
- Engine type B

Type A: electric motors with low starting torque (up to 1,5 times the rated torque).

Type B: electric motors with normal starting torque (1,5 to 2,5 times the rated torque).

Type C: electric motors with high starting and breaking torque (over 2,5 times the related torque).

# BELT INSTALLATION

A major difficulty installing transmission belts is to achieve the correct belt tension. The lifetime of the support bearings and transmission belts and, therefore, the reliability of the complete system largely depend on an optimally adjusted belt tension.

Pretension is the force needed to put tension into the system to avoid the belt jumping the pulleys as in the example beside:

**Not correct belt installation**

For a correct system installation, all applications with the MEGAFLEX belt can be summarized according to the following cases:

**Power transmission**

**Conveyor transmission**

In power transmission application, the pretension force is the load which has to be applied to the center of one of the driving system's pulleys in static conditions to avoid the derailing of the belt:

$$F_p = 2 \cdot F_v \cdot \sin \frac{\beta}{2}$$

$$z < 60 \quad F_v = \frac{1}{3} \cdot F_u$$

$$60 < z < 150 \quad F_v = \frac{1}{2} \cdot F_u$$

$$z > 150 \quad F_v = \frac{2}{3} \cdot F_u$$

- $z$  = belt teeth number
- $F_p$  = pretension
- $F_u$  = peripheral force
- $F_v$  = pretension on belt span
- $\beta = \pi - 2 \arcsin \left[ \frac{p(z_L - z_S)}{2 \cdot c} \right]$

For omega and conveyor transmission:  $F_p = F_u$

In omega application, to grant good mesh between the pulley and the teeth and to respect belt flexibility avoiding excessive stress on the cord, we suggest  $d = 4 \cdot$  belt width and angle  $\gamma = 120^\circ$ .

# BELT INSTALLATION

## PROCEDURE TO MEASURE

The procedure to measure the tension of the belt is to use belt tensioning equipment. This device consists of a small sensing head, which is held across the belt to be measured. The belt is then tapped to induce its vibration at its natural frequency. The vibrations are detected by the sensing head and the frequency of vibration is displayed on the measuring unit. The relation between the belt static tension ( $T_s$ ) and the frequency of vibration ( $f$ ) may be calculated using the following formula:

$$f = \frac{1}{2t} \cdot \sqrt{\frac{T_s}{m}} \quad \text{or} \quad T_s = 4 \cdot m \cdot t^2 \cdot f^2$$

### WHERE :

$T_s$ = static tension (N)	$f$ = Frequency of vibration in Hertz (Hz)
$m$ = Belt mass per unit length (kg/m)	$t$ = Free belt span length in meters (m)

For a correct system functioning and to increase the life of the belt, it is necessary a correct pulley installation: pulleys have to be parallel and aligned, as shown in drawing 1 (correct configuration). If pulleys are not parallel like in drawing 2, belt could fall during functioning and this can damage the complete equipment.

To grant a correct belt running,  $\alpha$  and  $\Delta x$  must be as small as possible. For more information, please contact our technical staff.

Drawing 1

Drawing 2

Drawing 3

# POSITIONING

## AND TRANSMISSION PRECISION

Backlash between the belt and the pulley teeth is very important for positioning precision and transmission synchronism.

To improve transmission precision, it is possible to use zero or reduced backlash pulleys. Please note that these pulleys don't reduce the elasticity of the belt teeth or cords.

The maximum recommended pulley teeth are:

<b>Till 100</b>	1/min	Z=40
<b>Till 500</b>	1/min	Z=30
<b>Till 1000</b>	1/min	Z=20

In following table, there is a list of the average values for backlashes:

AVAILABLE PITCH FOR "ZERO" BACKLASH PULLEY						
Average backlash value for standard	T5 XL	T10 L H	T20 XH	AT5	AT10	AT20
	0,6	1,2	2,4	0,2	0,4	0,8

RPP belts and pulleys offer great solutions for positioning systems because their parabolic profile reduces backlash and improves meshing quality.

# ANTISTATIC POLYURETHANE

## TIMING BELTS

Megadyne now offers antistatic belts. Under certain conditions, a polyurethane belt may build up a significant static electric charge. For applications where belts are intended for operation in a potentially explosive atmosphere or near electrical components, polyurethane belts should be sufficiently conductive to dissipate this electrical charge. Belts can be constructed (using proper nylon fabric coating) with a relatively low electrical resistance characteristic and are typically referred to as “static conductive” surfaces or “antistatic” surfaces. The test methods for determining the surface resistive properties of a belt are based on ISO 9563, “Belt Drives - Electrical Conductivity of Anti-static Endless Synchronous Belts - Characteristics and Test Method”. To be antistatic the electrical resistance, in ohms, of a belt measured in accordance with the test method of norm ISO 9563, should not exceed:

$$\text{Resistance} = \Omega = \frac{(6 \cdot 10^5) \cdot L}{W}$$

where:

- L = is the dry distance between electrodes (7 grooves, 6 teeth between contacts)
- W = is the width of the belt

*L and W are expressed in the same units (mm or inches).*

*Megadyne's antistatic belts are produced with black polyurethane as standard.*

### TYPICAL APPLICATIONS

- PC boards or other electronic assemblies industry
- Semiconductor processing
- Paper industry
- Power transmission applications in the textile industry
- Chemical environment power transmissions
- Clean room power transmissions

# MEASURING LENGTHS

## LENGTH TOLERANCES

MEGAFLEX are custom-made manufactured belts, they are available tooth by tooth on the following range:

- from 1500 mm to 22600 mm length
- from 1900 mm to 22600 mm length for nylon fabric teeth version

For AT10 and AT20 with HP, HPF and Kevlar® cords and for AT15, check length tolerance on belt data pages 25, 26 and 27:

### LENGTH TOLERANCES (mm)

UP TO	UP TO	UP TO
1700 mm ± 1,13	3750 mm ± 2,03	8000 mm ± 3,70
1900 mm ± 1,22	4000 mm ± 2,11	9000 mm ± 4,09
2120 mm ± 1,31	4250 mm ± 2,24	11000 mm ± 4,80
2240 mm ± 1,36	4500 mm ± 2,32	12000 mm on request
2360 mm ± 1,44	4750 mm ± 2,40	13000 mm on request
2500 mm ± 1,49	5300 mm ± 2,64	14000 mm on request
2650 mm ± 1,57	5600 mm ± 2,72	15000 mm on request
2800 mm ± 1,61	6000 mm ± 2,92	16000 mm on request
3000 mm ± 1,70	6300 mm ± 3,04	17000 mm on request
3150 mm ± 1,74	6700 mm ± 3,19	18000 mm on request
3350 mm ± 1,82	7100 mm ± 3,35	19000 mm on request
3550 mm ± 1,91	7500 mm ± 3,51	20000 mm on request

The above length tolerances are tested with following system.

# CLEATS

Megadyne's timing belts can be customised with profiles welded on the backside. All the cleats are made using the same thermoplastic polyurethane as the MEGAFLEX body (white PU 92 ShA).

The profiles are attached with the best technology available, the High Vibration System.

The production process for these profiles is very flexible; Megadyne can design any profile to meet the specific requirement of the customer, in order to check and develop all the needed special profiles.

## STANDARD PARALLELEPIPED PROFILES

Megadyne can produce, as standard cleats, the parallelepiped profiles, starting from a thermoplastic polyurethane strip roll and cutting to the requested profile dimension.

The  $t$  value (thickness) is available from 2 to 13 mm, the  $h$  value (height) can be from 3 to 120 mm and the width can be 150 mm maximum.

Megadyne recommends that the profile spacing were multiple of the belt pitch; in any case, for special inquiries and small quantities, it is also possible to weld the profiles in other positions; the feasible dimensions, with the standard process tolerances, are introduced in the following sketch.

The tolerances on the position are  $\pm 0.5$  mm.

The cumulative tolerance on the spacing of the profiles is the same as the length tolerance of our standard belts ( $\pm 0.8$  mm/m) (tighter tolerances are available on request).

Due to the welding process, a bead of material develops at the meeting point of the profile and the belt.

In any case, Megadyne always removes this welding bead.

## PROFILE MECHANICAL RESISTANCE

In order to find the right cleat dimensions, please consider the following factors:

- Section base cleats resistance ( $R$ ) becomes bigger, increasing:
  - Cleats width ( $w$ )
  - Cleats thickness ( $t$ )
- Cleat stiffness is bigger:
  - Increasing cleat thickness ( $t$ )
  - Using special moulded profiles, like STDE0006, STDE0008, STDE0010 and STMI0012 types

# CLEATS

## MINIMUM NUMBER OF PULLEY TEETH FOR BELTS WITH PROFILES

The profiles presence can change the belt flexibility properties; the two factors that affect the original flexibility are the following:

- Thickness of the cleat “foot“ (size of the base). Flexibility decreases when the welded area dimensions increase.
- Position of the welded profile on the belt. When the cleats are welded in the axis with the teeth, the belt flexibility is better than when cleats are welded in the axis with the little nose.

Please find, in the following table, the flexibility properties of cleated belts.

CLEATS OVER A TOOTH						
CLEAT THICKNESS	4	5	6	8	10	12

<b>RPP14</b>	20	20	30	40	45	54

## STANDARD PARALLELEPIPED PROFILES WITH HOLES

Parallelepiped profiles are available also with holes to satisfy special applications. Please find below the standard tolerances for this kind of cleats.

For belt flexibility and mechanical resistance, please kindly refer to values of cleats without holes.

## MOULDED CLEATS

Using a high-performance injection system, Megadyne can produce any profile designed by the customer. For cleats not yet present in following pages, Megadyne can produce dedicated mould according to customer requirements. For belt flexibility and mechanical resistance, please kindly refer to the standard parallelepiped profiles section.

# SPECIAL EXECUTION

## PHOTOS

### **AUTOMOTIVE INDUSTRY**

Transport Skids applications for the car industry.

### **MARBLE INDUSTRY**

Custom-made belt with special back grinding for cutting marble blocks.

### **FITNESS INDUSTRY**

Self-tracking belt for treadmill.

### **TEXTILE INDUSTRY**

High variety of cleats allow MEGAFLEX to work in several fields.

### **FOOD INDUSTRY**

High variety of compounds makes the MEGAFLEX belt suitable for different application.

# SPECIAL EXECUTION

## FEASIBILITY

### **LONGITUDINAL REWORK**

Longitudinal rework along the belt's back is possible on covered and uncovered belts. The profile can be machined precisely for the required function. The measurement is given by the depth on the belt's back. Most widths and lengths are available.

### **REWORK ON BELT TEETH**

The rework of the tooth profile can be very useful, i.e. improving the steering effect with guide rails. The rework dimension is given from the top of the tooth. Most belt widths and lengths are available.

### **HOLES IN TIMING BELTS**

Holes in timing belts can be for vacuum or air film conveying or as clearance for assembly mechanisms. Stops and cams can be attached through the holes. Customized tooling may be required depending on the layout and dimensions of the holes required.

### **SINGLE TOOTH REMOVAL**

Single and multiple tooth removal is available to your requirement, for applications in handling and conveying technology.

## SPECIAL EXECUTION

Megadyne can make special extrusions on customer request to improve the belt's properties and to suit better to special applications.

### **SPECIAL POLYURETHANE**

On customer request and with a minimum quantity, MEGAFLEX belt can be produced with different hardness:

- 90 ShA food quality polyurethane for contact with Food and medical products
- PU blue FCM certified for contact with food
- PU dark blue XMD (Metal and X-ray detectable)
- 92 ShA silicon free for painting system
- 95 ShA glass reinforced
- 98 ShA extra hard polyurethane
- 92 ShA higher resistance to temperature

### **COLOUR**

On customer request and with a minimum quantity, is possible to produce MEGAFLEX with several colours. A different colour doesn't influence the belt's technical properties, thence the mechanical features are the same as the standard white belt.

Available colours are: • White • Black • Blue • Yellow • Transparent • Grey

### **BIFILAR CORDS**

On request, all MEGAFLEX range can be manufactured with bifilar twisting cords.

### **SPECIAL THICKNESS AND BACK GRINDING**

All MEGAFLEX belts back are grinded. Sometimes additional grinding may be required to achieve a precise belt thickness as an adjunction to drive's precision. When belt back grinding tolerance is required, the total thickness, including the tooth, must be specified. A grinding tolerance of  $\pm 0,2$  mm is achievable with a good finish level (i.e. the thickness will not vary greatly around the belt). On request, it is possible to produce MEGAFLEX with extra thickness. Most widths and lengths are available.

# COVER PROPERTIES

MEGAFLEX belt can be coated with several materials. Those coatings are able to suit MEGAFLEX belts to all applications. The main advantages of using coated belts are the reduction of noise and the modification of the friction in conveying materials. The choice of the correct coating depends on the application field. Megadyne is able to supply extruded coated belts; in this case, the coating method is the same as the belt production method and the cohesion between the belt and the cover is guaranteed by welding without the use of glue.

Contact Megadyne's team for custom solutions.
